

Aether — Runtime Portability

Flagship Story

Deploy once. Move workloads across containers, Kubernetes, VMs, and bare metal without rewriting infrastructure.

One spec · Four runtimes · Explain · Migrate

Three **proof points**

What buyers should remember in 30 seconds.

1. One spec, four runtimes

Validate once with ``aether validate``. Deploy to Podman, Kubernetes, KubeVirt, or Metal3.

2. Production migration

16 pairs, blue-green default, rollback on failure, 30s drain cap. Honest limits on volumes/DNS.

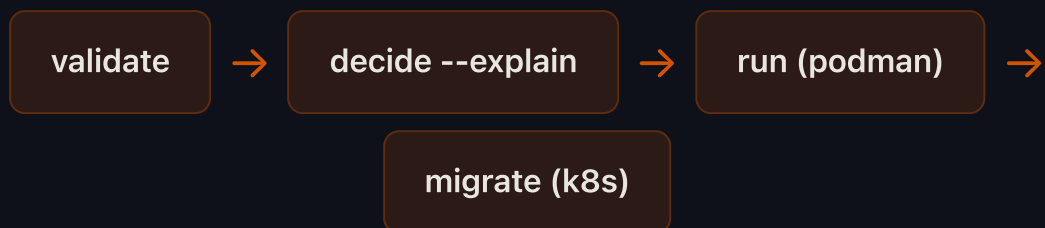

3. Explainable placement

``aether decide --explain`` and dashboard Intent Debugger show +/- per runtime.

Enterprise HA

Postgres state, Redis sessions, OIDC — see Deployment Topologies deck #02.

Live demo flow

```
aether decide --spec workload.yaml --explain  
AETHER_MIGRATION_TRACE=1 aether migrate app kubernetes --strategy blue-green
```

Demos: [examples/demos/01-03](#) · Recording: [docs/guides/demos/RECORDING-GUIDE.md](#)

Honest **limits**

Concern	Status
Workload state / spec	Supported
Health + rollback	Supported
Volume / disk data	Not automatic
IP / DNS	Manual cutover
Fleet federation	Roadmap
