

Aether

One declarative spec - containers, VMs, bare metal, and confidential computing.

Platform architects, DevOps leadership, hybrid and regulated infrastructure teams

Zyvor AI Labs · HyperSDK Platform suite

Executive summary

What Aether delivers in client terms.

Point 1

Define workloads once and target Podman, Kubernetes, KubeVirt, or Metal3 without rewriting deployment intent.

Point 2

Hardware-rooted trust on SEV-SNP and TDX with Kata/CoCo pods, measured images, and confidential live migration.

Point 3

19-page React dashboard with intent engine, trust tabs, and composite Ragnarok attestation hub.

CLI commands

Capability	Detail
Confidential VMs & pods	SEV-SNP/TDX on KubeVirt plus Kata RuntimeClasses - one confidential block in YAML.
Measured images	cosign sign/verify, fleet digest catalog, and deploy gates for strict confidential specs.
Confidential migration	confidential-blue-green strategy with re-attestation before cutover on TEE nodes.
Intent engine	Declare latency, cost, resilience, and isolation goals - Aether scores runtime options automatically.

Fit & use cases

Best-fit scenarios

- Hybrid programs where runtime choice changes by environment or compliance boundary.
- Regulated estates requiring TEE attestation, sovereign mode, and offline attestation bundles.
- Gradual modernization mixing containers, VMs, and bare metal under one operating model.

Suite context

- Composite with Ragnarok for attestation hub; GuestKit for offline preflight evidence.
- Pairs with IronWolf for bare-metal outcomes and HyperCluster for Kubespray + confidential fabric prep.
- PacketWolf auto CiliumNetworkPolicy for zero-trust east-west on confidential workloads.

Recommended **next steps**

- Best next step: map one application journey from development to production across your preferred runtimes.
- Ideal follow-on assets: deployment architecture review and environment promotion workflow demo.
