

Aether — TUI Dashboard

Interactive Terminal Dashboard

Monitor all workloads across all runtimes in a single terminal window. Real-time status, search and filter, log streaming, and keyboard-driven navigation — powered by Ratatui.

Real-Time Monitoring • Search/Filter • Log Viewer • Auto-Refresh

TUI Features

The Aether TUI provides a unified operational view of every workload across Podman, Kubernetes, KubeVirt, and Metal3 in a single terminal screen.

Real-Time Monitoring

The dashboard auto-refreshes every 5 seconds, querying each runtime adapter for current workload status. Running, pending, failed, and stopped states are displayed with color-coded indicators.

Search & Filter

Type `/` to activate the search bar. Filter workloads by name in real time. The search filter narrows the workload list as you type, making it easy to find specific services in large deployments.

Resource Detail Panel

Select any workload to see its full details: runtime, state, readiness, restart count, age, image, ports, and resource limits. The detail panel updates in sync with the workload list.

Log Viewer

Press `Enter` on a workload to open the log viewer. Stream logs in real time with automatic scrolling. Press `Esc` to return to the dashboard.

Dashboard Layout

```
+-----+
|           AETHER  Universal Runtime Control Plane  v0.1           |
+-----+
|  Total: 6  |  Running: 4  |  Failed: 1  |  Restarts: 2  |
+-----+
| WORKLOADS                | DETAILS                | |
| -----+-----+        | -----+-----+        |
| > my-api      kube  Running || Name:      my-api      |
| my-web       kube  Running || Runtime:   kubernetes  |
| cache        podman Running|| State:     Running    |
| ml-train     kubevirt Pend.|| Ready:    true        |
| db-primary   podman Running|| Restarts: 0           |
| gpu-node     metal3 Failed || Image:     my-api:latest |
|               || Ports:     8080:80      |
|               || CPU:       500m / 500m  |
|               || Memory:   256Mi / 256Mi |

| [Tab] Switch [/] Search [Enter] Logs [q] Quit [r] Refresh |
+-----+

Keyboard Navigation

The TUI is fully keyboard-driven. No mouse required — navigate, search, view logs, and manage workloads with a consistent set of key bindings.

Key	Action	Context
Up / Down / k / j	Navigate workload list	Dashboard
Tab	Switch focus between panels	Dashboard
Enter	Open log viewer for selected workload	Dashboard
/ (slash)	Activate search/filter bar	Dashboard
Esc	Close search bar or return to dashboard from logs	Search / Logs
r	Force immediate refresh	Dashboard
q	Quit the TUI	Any

Vim-Style Navigation

The TUI supports both arrow keys and Vim-style j/k navigation for moving through the workload list. This makes it natural for developers who use Vim, Neovim, or terminal-centric workflows.

The TUI is designed for operators who live in the terminal. Every action is one or two keystrokes away, with no mode confusion or hidden menus.

Runtime-Colored Status

Each runtime and state is displayed with a distinct color, making it easy to visually scan dozens of workloads at a glance.

State Colors

State	Color	Meaning
Running	Green	Workload is healthy and serving
Pending	Yellow	Starting up or waiting for resources
Failed	Red	Crashed, OOM, or health check failure
Stopped	Gray	Intentionally stopped or completed
Unknown	Purple	Runtime unreachable or state unclear

Runtime Badges

Runtime	Badge Style
Podman	Blue badge
Kubernetes	Green badge
KubeVirt	Purple badge
Metal3	Orange badge
Plugin	Cyan badge

Stats Bar

The stats bar at the top of the dashboard provides an at-a-glance summary:

Total	Running	Failed	Restarts
All tracked workloads	Healthy workloads	Unhealthy workloads	Total restart count

Auto-Refresh & Web Dashboard

The TUI refreshes automatically every 5 seconds. For browser-based monitoring, Aether also offers a web dashboard.

Auto-Refresh (5 seconds)

The TUI polls all runtime adapters every 5 seconds for fresh status data. Each runtime is queried concurrently — Podman via CLI, Kubernetes via the kube API, KubeVirt and Metal3 via CRD watches.

```
# Launch the TUI
$ aether tui

# The dashboard refreshes every 5 seconds
# Press 'r' to force an immediate refresh
# Press 'q' to quit
```

Web Dashboard Alternative

For teams that prefer a browser-based interface, Aether includes a web dashboard served on port 5090 with a login page and REST API.

```
# Start the web dashboard
$ aether serve
Server running at http://localhost:5090

# Or specify a custom port
$ aether serve --port 8080
Server running at http://localhost:8080

# The web dashboard provides:
# - Workload list with status
# - Real-time log streaming
# - REST API for automation
# - Login authentication
```

TUI vs Web Dashboard

Feature	TUI (aether tui)	Web (aether serve)
Access	Terminal / SSH	Browser (http://localhost:5090)
Refresh	Every 5 seconds	On page load / API poll
Search/Filter	✓	✓
Log Streaming	✓	✓
REST API	✗	✓
Authentication	OS user	Login page

Feature	TUI (aether tui)	Web (aether serve)
Best For	Operators, SSH sessions	Teams, shared dashboards

See Everything, **Everywhere**

One dashboard for all runtimes. Terminal or browser, the choice is yours.

Launch the TUI

```
# Start the interactive terminal dashboard
$ aether tui

# What you see:
#   - All workloads across Podman, Kubernetes, KubeVirt, Metal3
#   - Color-coded runtime badges and status indicators
#   - Real-time auto-refresh every 5 seconds
#   - Search/filter with '/' key
#   - Log viewer with Enter key
#   - Detail panel for selected workload

# Prefer a browser?
$ aether serve
# Open http://localhost:5090 for the web dashboard
```

Operational Visibility in Your Terminal

The Aether TUI replaces four separate runtime dashboards with a single, keyboard-driven interface. Real-time status, log streaming, and search/filter — all without leaving your terminal. For shared team access, spin up the web dashboard on port 5090.
